NATURE'S AND HUMAN'S MEDICINES

Holistic medicines usually include unmolested naturally occurring substances as vehicles for healing. If processing of some kind is necessary, it is done minimally to gently keep the wholeness intact and enhance the healing intent of nature's product if possible. This approach allows for beneficial effects on many levels of the patient's living system; mentally, emotionally as well as physical. The intact, whole remedy is a complete natural package, encouraging balance and restoration of health multidimensional. It is life adding to life, exploding into greater life...greater Health.

Laboratory chemicals are partially modifying, as they are usually partial substances from nature. The effects are but a quick fix; medicinal use with this intent has its place, even in holistic medicine; but to give it more credence and power in enhancing not only the length but the quality of life is indeed entering shaky ground. It is the completeness of a natural remedy merging with the completeness of the patient that allows for the possibility of cure in the greatest sense.

Laboratory synthesized chemical medicines add violence (agitation) to the living system on the mental, emotional and physical levels. Adding stripped versions of nature with the intent of removing the "bad" symptoms of disease; without knowing their complex effects usually leads to further imbalances localizing elsewhere in the physical, emotional or mental bodies. As a quick fix, chemicals are great when needed. If this is the intent: fine; if the goal is so short ranged and limited in context, indeed it will be reached again and again, leaving in it's wake greater disease outside the narrow definition of cure.

Continuing to treat disease and curing disease are two very different things. Knowing the intent prior to action will indeed make the action more fulfilling no matter what camp you are in, but do not try to make the two camps one; for the goals inherent within the two camps often times are seen as mutually exclusive. If there is a vested interest in treating disease, the cure is seen as a threat.

The therapeutic effects of chemicals are seen within a narrow context, as they were created for particular effects. Within this narrow formulation and experimental justification, chemical effects usually modify living systems at the expense of greater well being; this IS what a quick fix is. The newer chemical drugs are more sinister in their detrimental effects, but none the less powerful. Chemical medicines are usually crude (in their design and intent) compared to nature's products; this crudeness added to life usually results in partial, fragmented results of healing----one step up---one or two steps back.

Healing is different than symptom suppression. Chemicals can suppress symptoms very well, and in the narrow definition of disease (localized and limited to some body organ or part) it might appear the "disease" is gone. But disease is as flexible as thought; it can move through the body with

agility beyond the structure of nerve or blood vessel and appear beyond the myriad of forms seen under the microscope.

The present day high use of chemical medicines reflect a preferred safety in the known of human manufacturing as opposed to the "unknown" of nature's wisdom. Intent continually expresses itself in the results of our actions; whether it is in treating or curing disease. If the intent is respite from symptoms (suppression of symptoms) or the expansion of wholeness of life (cure of dis-ease), then so be it; each has its place, but know it is the place we assign to each.
