THE ENERGETICS OF IMMUNIZATION AND VACCINATION

The act of vaccination is meant here to give an antigenic material, usually through unnatural methods to induce immunization. Immunization is a series of biological responses by the vaccinated such that protection was created, where it wasn't available before vaccination.

The concept of vaccination is based on the mechanics initially understood from homeopathy. In this system of remedies, "like cures like"; giving the biological system an artificial short term disease (a remedy), temporarily displacing a more long term situation in which symptoms are seen. The theory is that this slightly more powerful short-term artificial disease helps the biological system on all levels in strengthening its response to the changing conditions of life. The symptoms of disease are a by-product of insufficient response to a perceived threat to the system on some level.

Vaccination does not confer immunity. Vaccination might express an underlying pre-existing immunity in term of observable titers or might stimulate the latent immune capabilities of the biological system and thus enhance quicker more efficient action in the future. A healthy immune system does not need vaccination, as it is capable and waiting to perform its function with minimal disturbance. Immunocompetence is a by-product of health, it is not conferred by vaccination.

Vaccination usually gives the biological organism of concern, or some product of its function or structure to stimulate a response in the recipient. This is isopathy (giving the exact same), where as homeopathy will prefer to give an unrelated substance or energy with a history of eliciting a similar symptom pattern. Vaccination rational is based on using the physical end product of weakened immunity and using it to remind other biological systems of the consequences of previous poor immunologic function.; it is spreading fear in the form of the product of immune incompetence.

In an ideal sense vaccination in its unfounded basis attempts to use an indication of weakened immunologic function (the organism itself or its products) as a means to strengthen the immune system. This is not only unfounded but often times counter productive. Where in fact vaccination agitates, distorts, and helps to corrupt the less competent immune systems --- those that need the help the most. In the short run it appears that susceptibility to a specific disease has been reduced (allaying human fear), when in fact this fear transfer is deposited deeper in the biological system as seeds for future chronic disease.

Vaccination as it is currently being over used in Veterinary medicine today helps alleviate the fear of acute disease in the client (and veterinarian) and transfers it into chronic disease in the patient. The Veterinary profession is viewed as "protecting" the animals for which it is monetarily compensated. Protecting from what? Where are the studies to show that animals annually vaccinated have a better protection against disease (even acute disease of the vaccine itself) than those vaccinated only as kittens or puppies?

Fear as the basis of action propagates fear in multitudinal forms. The fear of disease is the fuel of disease. This fear is the energetic basis of the immune system perceiving substances as threatening and mounting a response to harmless materials such as allergens and autoimmune substances. Most often the response itself is the disease. The fear of possible threat is the attacker; suicide at its best. Depositing the end-product of dysfunction as vaccination harms in more ways the systems in most need of support.

Humans fear disease, animals know it as transient restriction, easily making adjustments with very little complaint. Disease as a real thing for animals is non-existent; for they are ever in the flow of nature herself, yet they reflect how we see them. As the companion animal is the recipient of human thought, feeling and action it absorbs unconditionally the fear as well as the love. The human fear of acute disease as expressed in unsubstantiated over vaccination can only result in added chronic disease, fibrosarcomas and end stage renal disease are some of the best indicators of this disease transfer.

A healthy immune system functions silently in propagating health.
